

No	LIST OF TABLES	Page No.
1.1	Drainage characteristics of the Meda creek catchment	10
2 1	Stratigraphic setup of Saurashtra region (After Merh 1995)	18
3 1	Diversity of macro-benthic fauna along transect T1 and T2	53
3 2	Algal species present in the rocky intertidal	54
3 3	Locations of sediment and water samples from the Meda creek.	55
3 4	Physicochemical parameters of water in the Meda creek	73
4.1	Suggested temperature and pipetting time for clay separation	86
4 2	and, silt and clay percentage in the creek bottom sediments at various stations	88
4.3	Relative frequency of the sand-silt-clay in subsurface samples from the ancient tidal flat	91
4.4	Relative percentage of montmorillonite, kaolinite and illite in the profile samples	96
5 1	Foraminifera species distribution in the Meda creek.	112
5 2	Relative abundance of the microfauna in the subsurface sediments.	113
5.3	Relative abundance of various genus of foraminifera in subsurface samples	118
6 1	Summary of the Holocene history inferred out from the subsurface sediments of ancient tidal flat associated with the Meda creek.	139
