

List of Figures

Fig. No	Figure Details	Page No
Chapter I		
1.1	Block representation of Ideal AC-AC converter	2
1.2	A pictorial View of Motor Generator Set	3
1.3	Pulse-width modulated voltage source inverter	4
1.4	Direct AC-AC converters	6
1.5	a. Single half bridge ac power controller b. Single Phase Full Bridge AC power controller	7
1.6	Output Waveforms voltage and current waveforms of Single Phase Full Bridge AC power controller	8
1.7	a. Configuration of single-phase ac chopper b. Output voltage and load current waveforms	8 9
1.8	a. Three phase ac power controller with WYE connection b. Delta connection configurations.	10
1.9	General representation of Cycloconverter	10
1.10	Single-phase full bridge cycloconverters	11
1.11	Single-phase to single-phase cycloconverter waveforms a. Input voltage b. Output voltage for zero firing angle c. Output voltage with firing angle $\alpha/3$ rad. d. Output voltage with varying firing angle	12
1.12	3 ϕ -1 ϕ Half bridge cycloconverter	14
1.13	3 ϕ -1 ϕ Full bridge cycloconverter	14
1.14	3 ϕ -1 ϕ half-wave cycloconverter waveforms a.+ Converter output voltage b.Cosine timing waves c.- Converter output voltage	15
1.15	3 ϕ -3 ϕ half-wave cycloconverter	16
1.16	3 ϕ -3 ϕ half-wave cycloconverter	17
1.17	Block representation of voltage source inverters	21
1.18	Active filter topology for compensation of harmonic currents	22
1.19	Matrix converter	23
Chapter II		
2.1	Generalized structure of static transformer	30
2.2	Circuit scheme of a three phase to three-phase matrix converter, where a, b, c are at the input terminals and A, B, C are at the output terminals.	31

2.3	Switching constraints	32
	Short circuit between input phases	
	Open circuit for output phase	
2.4	Bi-directional switch configuration	34
2.5	Typical waveforms for a relatively low switching frequency are shown in figure above	37
2.6	Equivalent model of matrix converter for indirect mode operation	42
2.7	a. Input voltages, functions F1, F2 & F3, output voltage V_{AB}	45
	b. Gate pulses for Bidirectional switches	46
2.8	Simultaneous turning on operation leading to short circuit and turning off of two switches leading to high voltages due to breaking of inductive currents	47
2.9	Bidirectional Switch	48
2.10	Matrix converter with two-phase grid and single-phase load	49
2.11	State diagram of the soft-switching commutation method:	50
	a. For positive load current;	
	b. General case, i.e. load current of any polarity.	
2.12	Schematic representation of a matrix converter adjustable speed drive	51
2.13	Basic input filter configurations used in matrix converter prototypes.	52
2.14	Clamp circuit as common protection for all matrix converter bi-directional switches.	55
2.15.	Matrix converter with varistor protection	56
2.16	Gate driver with suppressor protection.	58
2.17	Output voltage waveforms generated by a VSI and a matrix converter	59
2.18	Matrix converter input current and harmonic spectrum. Switching frequency 2kHz.	60
2.19	Matrix converter input line-to-neutral voltage, instantaneous input current and its average value	61
2.20	Three-phase to single-phase full bridge Direct AC-AC converter	70
2.21	Three-phase to single-phase half bridge Direct AC-AC converter	71
2.22	Single-phase to three-phase ARNO converter	75
2.23	Single-phase to three-phase static converter using auto transformer	76
2.24	Single-phase to three-phase static converter using IGBT bridge	77

Chapter III

3.1	Three-phase to three-phase high frequency generator	83
3.2	Simplified power circuit diagram for the three-phase to single-phase direct high frequency AC-AC converter (half bridge configuration)	84
3.3	Simplified power circuit diagram for the three-phase to single-phase direct high frequency AC-AC converter (full bridge	84

	configuration)	
3.4	Modeling of bidirectional switch using two IGBTs with two anti-parallel diodes	89
3.5	The proposed Direct AC-AC high frequency link converter	90
3.6	The modified Direct AC-AC high frequency link converter	90
3.7	Waveforms of input phase voltages and its division into six sectors	92
3.8	Equivalent circuit diagram for sector one when S_{yn} & S_{bp} are conducting	96
3.9	Equivalent circuit diagram for sector one when S_{yn} & S_{rp} are conducting	96
3.10	Equivalent circuit diagram for sector one when S_{yp} & S_{bn} are conducting	97
3.11	Equivalent circuit diagram for sector one when S_{yp} & S_{rn} are conducting	97
3.12	A simplified transformer design	99
3.13	The ideal transformer as a circuit element	100
3.14	Three-phase inverter circuit	103
3.15	Block Diagram of three-phase inverter with SPWM technique	105
3.16	Principle of pulse generation using SPWM technique	105
3.17	Inverter reference signal; output voltage V_{ab} ; harmonic spectrum of V_{ab}	106
3.18	Three-phase inverter with R-L-E load	107
3.19	Equivalent inverter circuit during various switching states	109
3.20	The relationship of abc reference frame and stationary dq reference frame.	109
3.21	Basic switching vectors and sectors.	111
3.22	Voltage Space Vector and its components in (d, q)	112
3.23	Reference vector as a combination of adjacent vectors at sector 1.	114
3.24	Space Vector PWM switching patterns at each sector	115
Chapter IV		
4.1	Control block diagram for Direct AC-AC conversion	129
4.2	Absolute instantaneous value of three phase voltages	130
4.3	Zero crossing detector waveforms	130
4.4	Sector detection for all the phases	131
4.5	Sector detection for R-phase (positive and negative half cycles)	131
4.6	Divider Circuit using multiplier IC and opamps	133
4.7	Modulation function for all three phases	133
4.8	Positive and negative ramp generating circuit	134
4.9	Positive and negative slope ramps	134

4.10	Pictorial View of Analog circuits based control cards	135
	a. Sector determination and ZCD card	
	b. Divider card and duty cycle calculation card	
	c. Ramp generation card	
	d. Digital card for gate pulses	
4.11	Pictorial view of setup for all control cards inter connected to one another	136
4.12	Pictorial view of the DSP based control board	143
4.13	Pictorial view of the analog based complete set-up	144
4.14	Pictorial view of the DSP based complete set-up	145
4.15	Output of the high frequency transformer.	145
4.16	a. Input voltages and the input current without input ripple filter	146
	b. Input voltages and the input current with input ripple filter	146
4.17	Output line voltage for R-Y voltage	146
4.18	Output phase R-N voltage	147
Chapter V		
5.1	Three-phase to three-phase direct AC-AC converter	150
5.2	Block model of Direct AC-AC converter using IMO mode	151
5.3	Topology with 18 unidirectional voltage blocking switches	152
5.4	Topology with 12 unidirectional voltage blocking switches	152
5.5	Topology with 9 unidirectional voltage blocking switches	153
5.6	Input sine waveforms and sector calculation	154
5.7	Equivalent circuit during mode 1 of line side converter during interval 1	155
5.8	Equivalent circuit during mode 2 of line side converter during interval 1	155
5.9	Fully rectified waveforms of Three-Phase to Neutral voltages	165
5.10	Sector determination for all the three phases for primary side converter	165
5.11	Gate pulses for all three IGBTs of the primary side converter	166
5.12	Intermediate DC voltage and current	167
5.13	Input voltage and input current for one phase	167
Chapter VI		
6.1	Conventional telecommunication switch mode power supply	168
6.2	Proposed digitally controlled switch mode power supply based on matrix converter.	169
6.3	Semikron make 2-IGBT switch module for matrix converter implementation	170
6.4	A figure of three-phase to single phase matrix converter.	171
6.5	Illustration of matrix converter operation	171

6.6	Rectifier space vector hexagon.	173
6.7	Inverter mode switching function.	174
6.8	Block diagram of the proposed matrix converter modulation.	176
6.9	Matrix converter switch gating signals generating through logic gates.	176
6.10	The three-phase input voltages V_{ab} , V_{bc} , and V_{ca} : 208 V (rms) 60 Hz.	179
6.11	High frequency output voltage V_{pri} of the matrix converter.	189
6.12	Output DC voltage (48 V).	180
6.13	Input line to neutral input voltage V_{an} and input current I_a .	180
6.14	THD percentage at different loads	181
6.15	Proposed matrix converter prototype	182
6.16	Input voltage V_{ab} , matrix converter output voltage V_{pri} , and transformer secondary voltage V_{sec} .	182
6.17	Transformer primary V_{pri} and secondary voltages V_{sec}	183
6.18	Output DC voltage V_{dc} and load current I_{dc} .	183
6.19	Input line to neutral voltage V_{an} and the input line current $a I$ at 1.5 kW of output power	184
6.20	Development of power and size of wind turbines at market introduction	185
6.21	Schematic of connection of DFIM to the grid using AC-AC converter	187
6.22	Block of Control of DFIM using Direct AC-AC converter	190
6.23	Active and Reactive power flow in DFIG	192
6.24	Turbine characteristics and tracking characteristic	193
6.25	Rotor-side and grid-side converters and control systems <ul style="list-style-type: none"> a. Rotor and Grid side converters b. Rotor side controller c. Grid side controller 	194
6.26	V-I characteristics of a Wind Turbine	195
