MARKET COMPARISON OF PRICING AND MISPRICING

While in the previous Chapter Fundamental comparison of Disinvestment Pricing and mispricing are made, Market comparison of Disinvestment Pricing and mispricing are being made in this Chapter. This Chapter is divided in to two sections. Section – I deals with detailed computation of Market Values of All Assets and Modified Tobin's Q ratio. Section – II deals with Market Comparison of Disinvestment prices with Market Prices scientifically measuring by both, the short-term performances and the long-term performances.

SECTION – I

6.00 DETERMINATION OF MVAA AND MODIFIED TOBIN'S Q RATIO

This section deals with detailed computation of Market Values of Hard Assets of all 39 PSUs based on the methodology discussed at length, in sub-para VIII of para – 4.01, of Chapter IV. Derived Market Values of Hard Assets are used for the purpose of determination of Market Values of All Assets as well as for determining the values of Modified Tobin's Q ratio, *mutatis mutandis*. Besides determining the Market Values of Hard Assets, the Values of Soft Assets, which are normally not reflected on the balancesheet of PSUs, are also derived based on assumptions and the methodology discussed in detail alongwith the discussion made for determining Market Values of Hard Assets. By adding the derived values of Soft Assets to the Market Values of Hard Assets, total Market Values of All Assets of 39 PSUs are computed. To the derived total of Market Value of All Assets, all other tangible assets are added and all liabilities are deducted to derive net Market Value of All Assets available for the equity share holders. All these derived values discussed hereinabove are presented in Table 6.01. The resultant net Market Values of All Assets is divided by the number of equity share duly adjusted for bonus/ rights, etc , to derive Market Values of All Assets per equity share of Rs.10/-, for the purpose of the study. From analysis of derived Market Values of All Assets of disinvested PSUs, which are

presented in Table 6.01, it has been observed that in all 39 PSUs the derived Market Values of All Assets per share is different from the rest of the methods of pricing. As regard, values of Soft Assets, in 23 PSUs incidents of deriving positive values of Soft Assets, while in 13 PSUs incidents of deriving negative Soft Assets are observed. In the remaining 3 PSUs mixed results of positive and negative values of soft assets are observed. In all, mixed results of deriving positive and negative values of Soft Assets have also affected the consequent result of deriving Market Values of All Assets per share. While the detailed discussions on comparison of derived Market Values of All Assets with Disinvestment Prices are already made in the previous Chapter along with other Methods of Pricing selected for the purpose of the study, in this section PSU-wise computation of Market Values of All Assets is presented.

Moreover, alongwith the detailed computation of Market Values of Hard Assets and Market Values of Soft Assets, the derivation of Modified Tobin's Q ratio is also presented in the said Table 6.01. The Modified Tobin's Q ratio is computed for all PSUs covered for the purpose of the study, except for MMTCL in which case no listed price is available from the sources for determining the market value of equity. The ratio as a part of Market Comparison of Disinvestment Pricing is derived for all the remaining 38 PSUs for as many years as the listed market prices are available from the stated sources. It is observed that the time lag involved between the disinvestment month/year and the month/year of listing is astronomical ranging from a month to a more than a year or even not found listed for years as such in the case of MMTCL. Since, the derived value of Modified Tobin's Q ratio for a single year is not true reflection of wealth and expectation of investors in the market, the average value of Modified Tobin's Q ratio is computed and is exhibited in Table 6.16.

6.01 PSUWISE DETERMINATION OF MARKET VALUE OF HARD AND SOFT ASSETS AND MODIFIED TOBIN'S Q RATIO

Based on the detailed discussions made with regard to methodology of computation of market value of hard assets and soft assets in the Chapter- IV, PSU-wise determination of total market value of all the assets and Modified Tobin's Q ratio are calculated in a tabular form as under :

TABLE : 6.01

PSU-WISE DETERMINATION OF MARKET VALUE OF HARD AND SOFT ASSETS

SECTION – II

6.02 MARKET COMPARISON OF DISINVESTMENT PRICES

In this section, Market Comparison of disinvestment prices with the market prices is being carried out by covering the both, measurement of the short-term performances as well as the long-term performances of disinvested PSUs in the market. *Ceteris Paribus*, market comparison of Disinvestment pricing is as equally important as fundamental comparison of economic prices. However, any of the standalone comparison may impart awry results, which may lead to raunchy decisions and thus, results in to suboptimal realisations from disinvestment.

There are abundant evidences that initial public offerings of privately owned companies tend to be under priced. Ibbotson¹ (1975), Ibbotson, Sindelar and Ritter² (1988), Logue³ (1973), Mc Donald and Fisher⁴ (1972), Ritter⁵ (1984, 1991) studied the IPOs in the USA. Ritter and Rydqvist⁶ (1994) and Moonchul Kim, Jay R Ritter⁷ (1998) also studied the valuation of IPOs. However, no much publicly reported literature is available barring a few for the state owned public companies.. Dewenter and Malatesta⁸ (1996) had studied the analysis of initial offer prices in privatization of state owned companies compared to IPOs of private companies.

Keeping in view the above, the market based comparative analysis of disinvestment pricing and mis-pricing is also conducted in this study both on short term basis as well as on long term basis. Normally short term period has been defined as day 1 through day 30 and long term horizon is consider as year 1, year 2, year 3, year 4 . year (n). Based on the availability of market data of initial and subsequent market prices of disinvested PSUs from the sources of Capital Market⁹ published by Investwel Publishers Pvt Ltd. and The Stock Exchange official directory of Bombay Stock Exchange (Vol. 1 To 18),¹⁰ the researcher has compared the phenomena of mis-pricing by comparing for varied time period, the actual market prices with disinvestment prices. For the purpose of the present study, the model applied by Dewenter and Malatesta¹¹ (1996) have been followed, except the short term period of

^{7th} day, the 15th day is taken in the present study, as data were not available for the 7th day. It is imperative to mention here that the study of Dewenter and Malatesta (*supra*) did not compare the long term performance of IPOs of privatization, like the study of Jay R. Ritter¹². However, in the present study of the researcher, both types of market performances viz. short term performance as well as long term performance in the market have been compared, collated and scientifically analyzed.

Analysis of comparing the market prices with Disinvestment Prices of each PSUs as well as the portfolio of disinvested PSUs, both on short term basis and long term basis are carried out. In this analysis, both the raw returns christened as unadjusted returns (UAR) and market adjusted returns (MKAR) for the short term and long term basis are computed as follows:

(a) **UAR** is defined as

$$\text{UAR} = \log(P_{it}) - \log(P_{10})$$

Where,

P_{it} = Average equity share price of PSU on day t following initial listing / trade in the market ($t = \text{day } 1, 15, 30$) for short term and last day of the financial year for long term basis.

P_{10} = Annual average Disinvestment price of the PSU

(b) **MKAR** is defined as

$$\text{MKAR} = \text{UAR} - [\log(I_{ct}) - \log(I_{co})]$$

Where,

I_{ct} = Selected Stock Market Index (BSE SENSEX) level for Day t / year

I_{co} = Selected Stock Market Index (BSE SENSEX) level for the month/year of disinvestment is made on an average basis

Accordingly, the data for UAR and MKAR are determined and are exhibited in the tabular form in Table : 6.02 (*infra*).

6.03 SHORT TERM MARKET COMPARISON OF MIS-PRICING

Table 6.02 exhibits data in percentage term of unadjusted returns and market adjusted returns for the major disinvestments made in the disinvestment year 1991-92 through 1995-96 for the 1st day available market price followed by 15th day and 30th day

respectively. From the analysis of Tables 6 02 and 6 03, it has been observed that the average unadjusted returns for the first day is 35.44%, for the 15th day is 31.37% and for 30th day is 30.52% respectively. Similarly the average market adjusted returns for the first day is 24.74%, for the 15th day is 22.38% and for 30th day is 16.20% respectively. These results of abnormal returns over first disinvestment price itself evidences the fact that there were under realisations from the disinvestment decisions in keeping with the research results found from fundamental analysis of disinvestment pricing and mis-pricing in the Chapter-V. Moreover, these observations are also in keeping with earlier reported studies that IPOs are under priced (*supra*)

From the analysis of descriptive statistic it has been observed that in India the investor having invested in the portfolio of 39 PSUs under reference, have realised Grand Mean (Median) of unadjusted returns of 35.44% (41.85%) on the 1st day basis, 31.37% (40.10%) on the 15th day basis and 30.52% (37.97%) on the 30th day basis. The observed values of range of standard deviations evidence the existence of probability to out-perform the market with appropriate risk return trade-off. The negative value of skewness evidences that median value of unadjusted returns is more than the mean value of unadjusted returns. Above all, it is interesting to note that the range of 1st day returns was ranging from a maximum of 100% and a minimum of (-) 92%. Similar results are also found for the 15th day and 30th day unadjusted returns with a 10% deviation

As regards market adjusted returns of portfolio of 39 PSUs, the Grand Mean (Median) market adjusted returns of 24.74% (34.38) for the 1st day initial returns, 22.38% (35.05%) for the 15th day returns and 16.19% (35.78%) for 30th day returns. Observed value of standard deviation ranging from 39.61 to 47.66 evidences the existence of the probabilities to out perform the market and earn super normal profit, *inter alia*, due to under pricing of disinvestment price. This is further buttressed by the observed range value of 186.90% for the 1st day, 193.93% for the 15th day and 193.20% for the 30th day. Keeping in view the above discussed analysis of short term unadjusted returns and market adjusted returns of initial day, 15th day and 30th day

respectively, *a posteriori*, it establishes the existence of phenomena of under-pricing of initial disinvestment price of Indian PSUs on market basis, as well.

TABLE : 6.02

SUMMARY OF INITIAL SHORT TERM RETURNS FROM DISINVESTMENT

NOTES :

- (a) 1st day = 1st Initial available listing day unadjusted returns as defined.
- (b) 15th day = Unadjusted Return for the 15th day following the first day/initial price
- (c) 30th day = Unadjusted Return for the 30th day following the first day/initial listed price.
- (d) 1st day = First day initial available listed price Market Adjusted Returns as defined.
- (e) 15th day = Market Adjusted Returns for the 15th day following the available 1st day/initial listed price
- (f) 30th Day MKAR = Market Adjusted Returns for the 30th day following the available 1st day/initial listed price.
- (g) P N.= Market Prices of PSUs not available from the sources of data selected/ official public records.
- (h) For measurement of the short term performances, the percentage UAR and MKAR are derived by comparing the first disinvestment price with the benchmark market prices of the 1st day, 15th day, and 30th day respectively
- (i) Market Prices are the average of a high and a low of period , and the same is taken from Capital Market , The Stock Exchange official directory and market quotations of equity price published by Tax Man.

Notes :

- (1) Mean =1st day, 15th day and 30th day average of Unadjusted Returns following the average month of disinvestment Likewise, for the Market Adjusted Returns.
- (2) N.L. =Not listed on the Stock Exchange during the period under reference.
- (3) Notes as mentioned beneath the Table 6.02

6.04 LONG TERM MARKET COMPARISON OF MIS-PRICING

Statistical and Economic evidences of short term under pricing of initial disinvestment price of PSUs have been found and have been discussed in the previous paras. With a view to analyse the market performances of disinvested Indian PSUs on the long term basis the similar tests have also been carried out by taking longer time horizon interval of a year, following the year of disinvestment. Thereafter, longer time horizon of a period upto 31.3.98 are taken in consideration by comparing Disinvestment Price with Market Prices, for the disinvestment years 1991-92, 1992-93, 1994-95 and 1995-96 respectively through 1997-98.

(i) DISINVESTMENT YEAR 1991-92

Accordingly, Table 6.04 exhibits PSU-wise and year-wise unadjusted returns and Table 6.05 market-adjusted returns following the year of 1st major disinvestment year 1991-92 through 1992-93, 1993-94, 1994-95, 1995-96, 1996-97 and 1997-98. Likewise, Table 6.15 exhibits the summary of descriptive statistics of unadjusted returns and market adjusted returns covering both the PSUs-wise and year-wise, such as mean, median, standard deviation, kurtosis, skewness, range a minimum and a maximum of a range. Table 6.06, summarizes the year-wise summary of descriptive statistics in a portfolio form of all the PSUs for all the subsequent years following the disinvestment year 1991-92.

From the analysis of data presented in these tables for the disinvestment year 1991-92, the results found positive Unadjusted Returns in 23 PSUs with negative UnAdjusted Returns in 6 PSUs. The Grand mean of unadjusted returns of all the PSUs for all the years under reference ranges from a low of (-) 16.87% to a high of more than 100%. The range of Unadjusted Returns hovered from 0 % to 139% amongst the disinvested PSUs. Likewise, in 21 PSUs positive Market Adjusted Returns have been observed with negative Market Adjusted Returns in the case of 8 PSUs. The observed value of Grand mean of Market Adjusted Returns ranges from a low of (-) 30.07% to a high of more than 100%. From the year wise analysis, of Un-adjusted Returns of long term performance of disinvested PSUs, the observed mean value of Unadjusted Return (Market Adjusted Returns) for the year 1992-93 is 49.26% (38.11%), for the 1993-94 is 58.64% (50.87%), for 1994-95 is 40.72% (17.22%), for 1995-96 is

29.64% (18.79%), for 1996-97 is 30.01% (18.34%) and for the 1997-98 28.83% (14.58%) respectively, with the median value ranging from 18.42% (4.17%) to 54.84% (47.07%). The range of year-wise Un-Adjusted Returns (Market Adjusted Returns) observed a high of 232.66% (232.60%) to a low of 164.34% (164.34%). These observations, *a fortiori* establish on record that there was under pricing of disinvestment of equity shares in the initial year of disinvestment with decelerating returns in the subsequent long period. In view of the observed value of decelerating returns from disinvestment year to subsequent years on long term basis, in India as well, the evidence of under performance in market on long term basis has also been observed with varying degree of under performance of Indian PSUs. These results are in keeping with the findings concluded by Jay R. Ritter¹³

(ii) DISINVESTMENT YEAR 1992-93

Table 6.07 and 6.08 exhibit PSU-wise and year-wise Unadjusted Returns and Market-Adjusted Returns respectively, for the second major disinvestment year of 1992-93 through 1992-93, 1993-94, 1994-95, 1995-96, 1996-97 and 1997-98. Table 6.09, summarizes the year-wise summary of descriptive statistics in a portfolio form of all the PSUs for all the years of disinvestments.

From the analysis of observed data presented in these tables alongwith Table 6.15, the results found positive Unadjusted Returns in 6 PSUs with negative Un-Adjusted Returns in 10 PSUs. The Grand mean of unadjusted returns of all the PSUs for all the years under reference ranges from a low of (-) 89 84% to a high of 75.44%. The range of Unadjusted Returns hovered from 0% to 79 33% amongst the 16 disinvested PSUs. Likewise, in 5 PSUs positive Market Adjusted Returns have been observed with

negative Market Adjusted Returns in the case of 11 PSUs. The observed value of Grand mean of Market Adjusted Returns ranges from a low of (-) 77.18% to a high of 34.6%. From the year-wise analysis of Un-Adjusted Returns of long term performance of disinvested PSUs, the observed mean value of Unadjusted Return (Market Adjusted Returns) for the year 1992-93 is 0.50% (-0.76%), for 1993-94 is 4.55% (5.74%), for 1994-95 is -17.43% (-26.55%), for 1995-96 is -20.00% (-18.26%), for 1996-97 is -18.13% (-19.88%) and for the year 1997-98 is -21.63% (-25.78%) respectively with the median value ranging from -26.26% (-30.74%) to 21.67% (8.23%). The range of year-wise Un-Adjusted Returns (Market Adjusted Returns) observed a high of 84% (87%) to a low of -111% (-36%). The results observed for the long term performance of the second year of disinvestment with Market prices are positive for the first two years and thereafter, (from 1994-95 onwards) results of under-performance have been found for this year as well. The observed results of the study buttressed the phenomena of under pricing of disinvestment, like in the disinvestment year 1991-92, albeit by a relatively lesser percentage.

(iii) DISINVESTMENT YEAR 1994-95

Accordingly, Tables 6.10 and 6.11 exhibit PSU-wise and year-wise Unadjusted Returns and Market-Adjusted Returns respectively for the third major disinvestment year 1994-95 through 1994-95, 1995-96, 1996-97 and 1997-98. Table 6.12 summarizes the year-wise summary of descriptive statistics in a portfolio form of all the PSUs for all the years of disinvestments

From the analysis of observed data presented in these two tables alongwith Table 6.12, the results found positive Unadjusted Returns in 3 PSUs with negative Un-Adjusted Returns in 13 PSUs. The Grand mean of unadjusted returns of all the PSUs for all the years under reference ranges from a low of (-) 126.71% to a high of 65.75%. The range of Unadjusted Returns hovered from 0% to 52.66% amongst the 16 disinvested PSUs. Likewise, in 7 PSUs positive Market Adjusted Returns have been observed with negative Market Adjusted Returns in the case of 9 PSUs. The observed value of Grand mean of Market Adjusted Returns ranges from a low of (-) 117.64% to a high of 58.39%. From the year wise analysis of Un-Adjusted Returns of long term performance of a portfolio of all the disinvested PSUs, the observed mean value of Unadjusted Return (Market Adjusted Returns) for the year 1994-95 is -30.02% (-16.30%), for 1995-96 is -30.92% (-9.89%), for 1996-97 is -22.35% (-5.66%) and for the 1997-98 is -23.79% (-13.80%) respectively with the median value ranging from -30.49% (-0.85) to -10.76% (13.30%). The range of year-wise Un-Adjusted Returns (Market Adjusted Returns) observed a high of 177% (177%) to a low of 133% (133%). These observations, *a fortiori* itself evidence the fact that especially in this year the sovereign divestor had realised relatively better prices from the disinvestment of shares than those realised in the year 1991-92 and 1992-93. However, it is pertinent to mention that this year was adversely affected due to anthology of security scam followed by lower market prices and perceived market realisations of ambivalent political policy towards disinvestments

(iv) DISINVESTMENT YEAR 1995-96

Table 6.13 exhibits PSUs-wise and year-wise unadjusted returns and market-adjusted returns following the fourth (last) year of major disinvestment 1995-96 through 1995-96, 1996-97 and 1997-98. Table 6.14 summarizes the year-wise summary of descriptive statistics in a portfolio form of all the PSUs for all the years of disinvestments.

From the analysis of observed data presented in these tables alongwith Table 6.15, the results found positive Unadjusted Returns in two PSUs with negative UnAdjusted Returns in two PSUs. The Grand mean of unadjusted returns of all the PSUs for all the years under reference ranges from a low of (-) 21.95% to a high of 62.76%. The range of Unadjusted Returns hovered from 13% to 51.37% amongst the 4 disinvested PSUs. Likewise, in 2 PSUs positive Market Adjusted Returns have been observed with negative Market Adjusted Returns in the case of 2 PSUs. The observed value of Grand mean of Market Adjusted Returns ranges from a low of (-) 17.51% to a high of 67.20%. From the year wise analysis of Un-Adjusted Returns of long term performance of portfolio of all the disinvested PSUs, the observed mean value of Unadjusted Return (Market Adjusted Returns) for the year 1995-96 is 5.27% (8.22%), for 1996-97 is 16.57% (20.46%) and for the 1997-98 is 15.59% (22.07%) respectively with the median value ranging from 0.89% (3.84) to 12.14% (16.82%).

The range of year-wise Un-Adjusted Returns (Market Adjusted Returns) observed a high of 123% (123%) to a low of 39% (39%). From the overall analysis of observed results of this year of disinvestment, the similar results are found as found for the first year of disinvestment.

To wit, the overall long term market performance of disinvested PSUs in India, it is found that in the initial years following the disinvestment, the phenomena of under-realisations due to under-pricing have been observed. Thereafter, gradually when the market recognizes the weaknesses/ limitations of both the hard and the soft factors of the Indian PSUs accompanied by politically ambivalent **brushfire approach** to disinvestment, it turned into under performance in the long run. However, from the analyses of the observed research results, it can be clearly concluded that it was possible for the investor to earn the **melon profit** from the under-priced disinvestment of Indian PSUs, *albeit* with appropriate **risk-return-timings trade-off** of the investments, not only based on the fundamental economic valuation but also in the market place, as well.

6.05 LONG TERM MARKET PERFORMANCE OF MIS-PRICING BASED ON AVERAGE OF MODIFIED TOBIN'S Q RATIO

Besides, comparing the long term market performances of disinvested Indian PSUs as aforesaid, one more measure of under performance in terms of under-valuation of equity share prices of PSUs under reference have been measured in terms of modified

Tobins Q Ratio. While the detailed computation of PSUs-wise modified Tobins Q-Ratio have been depicted in the Table 6.01 (*supra*), the derived values of average of Modified Tobin's Q- ratio for all the PSUs are exhibited in Table 6.16 hereunder.

Source: Processed from the data presented in the Table 6.01 (*supra*)

By statistically processing the derived values of average of Modified Tobin's Q ratio presented in the above Table, the summary of range wise values of averages of Modified Tobin's Q ratio is presented in the Table : 6.17 hereunder.

TABLE : 6.17

SUMMERY OF AVERAGE VALUE OF MODIFIED TOBINS Q- RATIO AS LONG TERM PERFORMANCE MEASURE OF MIS-PRICING

RANGE VALUE OF Q- RATIO	Nos. OF PSUs	MEAN VALUE
0.00 TO 0.25	03	0.14
0.26 TO 0.50	18	0.35
0.51 TO 0.75	07	0.58
0.76 TO 1.00	02	0.92
MORE THAN 1.00	08	2.39
TOTAL	38	0.84

Note: In absence of availability of Market price for M/S MMTCL, the Q ratio is computed for 38 PSUs.

Source: Processed from Table : 6 16 (*supra*).

From the analysis of research results presented in Tables 6.16 and 6.17, it has been found that the Grand mean value of the modified Tobin's Q- ratio of all 38 PSUs is 0.84, which itself evidences the fact of not recognizing the **stash value and wealth** of the disinvested PSUs by the market and the investors. Moreover, in 3 PSUs the under valuations are ranging upto 0.25 Q-ratio, in 18 PSUs it ranges from 0.26 to 0.50, in 7 PSUs it ranges from 0.51 to 0.75 with 2 PSUs ranges from 0.76 to 1.00. However, in 8 PSUs the observed value of this ratio is more than the value of one, especially in the petroleum sector and Tele-communication sectors. Therefore, based on this measure of the long term performance of disinvested Indian PSUs as well, under performances are observed barring a few PSUs.

To wit, the analysis of research results observed from the study under reference, *a posteriori*, it is summarised as under

- (a) In implementation of strategy of valuation and pricing of a share for disinvestment, it is desideratum to derive net market value of Hard Assets and Soft

assets, which are not recognized on the reported financial statements, *inter alia*, to optimize logically realisations of disinvestment. The researcher has attempted to provide the unique and plausible methodology for deriving the net Market Value of All Assets, which will undoubtedly help both the acquirer and the divestor in the process of due diligence. This method also imparts different economic value as compared to other methods of pricing. Since, in India the Sovereign State had created huge amount of Hard Assets in the era of low inflation with many sacrifices by the citizens, the discovery of this new method by the researcher, of deriving Market Value of All Assets will be a **potent recipe** as a new method of price discovery for the disinvestment decision.

(b) The Modified Tobin's Q ratio helps ensure the decision-maker whether the market has realised the true value and wealth of an enterprise. Based on the research results, in India , the market has not realised the true value and wealth of disinvested PSUs. This itself evinces the need for innovative strategy of valuation and pricing for disinvestment. Strong and Statistically significant evidences of underpricing/realisations from disinvestments are also found, from the *market comparison* of market prices with disinvestment prices, both on short term basis and on long term basis (except for the year 1994-95 on long term basis for the reasons explained), in addition to the *fundamental caparison* of economic prices derived from Selected Network of Pricing Methods.
