List of Figures

1.1: The nuclear phenomenon takes place based on the impact factor of the incoming projectile. Schematic representation of involved processes based on impact factor……3

1.2: Different stages of nuclear interaction when the projectile is bombarded on the target nucleus. ……...……4

1.3: Schematic presentation of a transfer pick-up reaction. …….6

1.4: Schematic presentation of a transfer stripping reaction……6

1.5: Schematic presentation of a transfer knock-out reaction……..6

1.6: Schematic representation of the formation and decay of Compound Nucleus (CN)…….8

1.7: Energy spectra for charge particles and neutrons. Figure is taken from J. S. Lilley, Nuclear Physics – Principles and applications (John Wiley and Sons Ltd……..9

1.8: Differential cross section for an outgoing particle for direct reaction and decay of compound nucleus……..……..……..10

1.9: Cluster structure in some weakly bound stable and unstable nuclei……..……11

1.10: The detailing of the process when weakly bound projectile nuclei interact with target nuclei. A typical example taken over here is WBP ^{6}Li (α+d). ……..13

1.11: Part of Segre chart containing weakly bound category of nuclei…….13

1.12: Typical example of TA behavior for system ^{16}O+ ^{208}Pb…..……...…….17

1.13: Typical example of BTA behavior for system ^{6}Li + ^{208}Pb…..…….17

2.1: Schematic block diagram of a typical pellletron accelerator tank ….. ……..……28

2.2: Deposition of ^{92}Mo during the run and internal view of the chamber after deposition respectively……32

2.3: Floating off the thin film and taking on SS target frame for target fabrication……32

2.4: Schematic illusion of ΔE-E telescope detector setup. ΔE is the thinner solid state/gas detector …….…….34

2.5: Schematic block diagram of electronic setup corresponding to the experimental arrangement in the thesis……..……..……36

2.6: Illustrative example of the form of Wood-Saxon potential…….……...……..……38

2.7: There is integration over two densities and therefore it is called the double folding model……..42

2.8: The liner segments of W(r, E). The figure is taken from reference ..……...….44

2.9: Represent the coordinates of arrangement and now the three body becomes two body…...48

3.1: Photograph of mounting arrangement for detector telescopes (T1, T2, T3, and T4), Monitors (M1, M2), target ladder, and Faraday cup (outside the chamber)……...……..55

3.2: Particle ΔE-(E+ΔE) spectrum at E_{lab}=25.7MeV, θ_{lab}=40°, for the system ^{6}Li+^{51}V……...56

3.3: Elastic scattering angular distribution data fitting through Woods –Saxon potential ……...58

3.4: The sensitivity radius deduced from optical model analysis for the imaginary part for the system ^{6}Li+^{51}V at energies a) 14 MeV b) 12 MeV……..……..59

3.5: Elastic scattering angular distribution data fitting through the microscopic double folding model……..60

3.6: Left panel: Real and imaginary potentials at sensitivity radius R=9.4 fm using optical model. dynamic polarization potential (DPP) (ΔV, ΔW) and bare + DPP, these calculations are obtained from CDCC calculations. Right Panel: Real (N_R) and imaginary (N_I) normalization factors from the microscopic double folding model. ……..……..…….63

3.7: Result of CDCC calculation for real (ΔV) and imaginary (ΔW) polarization potential around sensitivity radius (9.4 fm). ……...……..65

3.8: Real and Imaginary normalization factors for systems ……. ……..……..67

3.9: (a) Reduced reaction cross section for targets from different mass regions with ^{6}Li. (b) The ratio of systematic radius $R^{i}_{sys}= 1.12A_i^{1/3} – 0.96\ A_i^{-1/3} + 3.75$ fm to spherical radius $R^{i}_{SP} = 1.3\ A_i^{1/3}$ fm is given in the inset. ……..……..……..68

3.10: A systematic reaction cross section for a variety of projectile categories viz. strongly bound, Weakly bound, and rare ion beam with target ^{51}V. ……..…….69

4.1: Particle ΔE-(E+ΔE) spectrum at E_{lab}=19.7MeV, θ_{lab}=30°, for the system ^{6}Li+^{51}V……77

4.4: Energy integrated angular distribution of α-particles at various energies (a) 25.7 MeV, (b) 22.7 MeV, (c) 19.7 MeV, and (d) 13.6 MeV at ^{6}Li+^{51}V. ……..……..81

4.5: Schematic diagram of coupling states included for Coupled Reaction Channel Calculations (CRC) for 1-n transfer…….……..…….85

4.6: Schematic diagram of coupling states included for Coupled Reaction Channel Calculations (CRC) for 1-p transfer……...……...……..86

4.7: The contribution of several possible reaction channels to direct α production viz. non-capture breakup, 1 p transfer , 1 n transfer , 1 d transfer , transfer + Non-capture breakup (NCBU) , and Incomplete fusion +transfer +NCBU .…….……..……...88

4.8: Experimentally deduced direct α- particle cross section for 6Li with various targets. …….90

4.9: A ratio showing relative production of α- production cross section to deuteron production cross section for various targets around the Coulomb barrier. …….91

5.1: Schematic diagram of the GPSC chamber of the experimental setup for the experiment….99

5.2: Schematic diagram of the inner view of GPSC chamber of the experimental setup for the experiment……..…… .100

5.3: An energy calibrated experimental spectra **(a)** for the system ^{7}Li+^{92}Mo at energy E_{lab} = 35 MeV and θ_{lab} = 27°; **(b)** the projection of the drawn box reveals the first few inelastic states of target ^{92}Mo…….101

5.4: Elastic scattering angular distribution data fitting through Woods –Saxon potential (WSP) and São-Paulo Potential (SPP for system ^{7}Li+^{92}Mo and diamonds for system ^{7}Li+^{100}Mo…… 104

5.5: The sensitivity radius deduced from optical model analysis for the real and imaginary parts for the system ^{7}Li+^{100}Mo system at energies 21.5 MeV and 30 MeV respectively……..…..105

5.6: Left panel: Real and imaginary potentials at sensitivity radius R=9.58 fm using optical model WSP . Right panel: Real and imaginary potentials at sensitivity radius using optical model SPP for system^{7}Li+^{92}Mo……..…109

5.7: Left panel: Real and imaginary potentials at sensitivity radius R=10.28 fm using optical model WSP. Right panel: Real and imaginary potentials at sensitivity radius using optical model SPP. for system ^{7}Li+^{100}Mo…….…….……110

5.8: The CDCC calculations are demonstrated with and without including breakup coupling effects for the system ^{7}Li+^{92}Mo……..…….....112

5.9: The CDCC calculations are demonstrated with and without including breakup coupling effects for the system ^{7}Li+^{100}Mo…….113

5.10: A Comparative study of the experimental cross section with CDCC calculated reaction cross section and breakup cross section for $^{7}Li+^{92,100}Mo$ systems. ……..114

.**5.11:** The comparative plot for total fusion cross sections (σ_{fus}) calculated by CCFULL and the total reaction cross sections (σ_R) for the systems $^{7}Li+^{92}Mo$, $^{7}Li+^{,100}Mo$, and $^{6}Li+^{,100}Mo$ ……..117

5.12: Reduced reaction cross section for targets from lighter to heavy mass regions with ^{7}Li.. 118

6.1: Schematic diagram and inner view of GPSC chamber of the experimental setup for the experiment…….……...127

6.2: Elastic scattering angular distribution data fitting through Woods –Saxon potential for system $^{7}Li+^{100}Mo$. ……..130

6.3: The sensitivity radius deduced from optical model analysis for the real and imaginary parts for the system $^{6}Li+^{100}Mo$ system at energy 23 MeV……..132

6.3: Real and imaginary potentials at sensitivity radius R=10.97 fm using optical model WSP (blue solid circle)……..……...……134
